Executive Summary

This document forms a Preliminary Flood Risk Assessment (PFRA) report for the London Borough of Southwark in accordance with the Flood Risk Regulations 2009.

The PFRA provides a high level summary of significant flood risk, based on available and readily derivable information, describing both the probability and harmful consequences of past and future flooding. The scope of the PFRA is to consider flooding from the following sources; surface runoff, groundwater and ordinary watercourses and any interaction these may have with main rivers and the sea.

According to readily available datasets, the London Borough of Southwark has experienced a number of past surface water flood events (some of which affected local infrastructure), however they have not been deemed to have had significant consequences for human health, economic activity, the environment and cultural heritage and have therefore not been recorded in Annex 1 of the PFRA spreadsheet.

It has been agreed in conjunction with the Environment Agency and the London Borough of Southwark that the Drain London Surface Water Management Plan outputs from the Drain London Project will form the locally agreed surface water information for the London Borough of Southwark. A review of locally agreed surface water information demonstrates that 33,220 residential properties and 2,870 non-residential properties in the London Borough of Southwark could be at risk of surface water flooding of greater than 0.03m depth during a rainfall event with a 1 in 200 annual chance of occurring. Of those, 560 residential properties and 80 non-residential properties are estimated to be at risk of flooding to a depth of greater than 0.5m during the same modelled rainfall event.

The London Borough of Southwark is included in the Flood Risk Area for Greater London. No changes are proposed to this Flood Risk Area.

1. Introduction

1.1 WHAT IS A PRELIMINARY FLOOD RISK ASSESSMENT?

1.1.1 A Preliminary Flood Risk Assessment (PFRA) is a high level screening exercise to identify areas of significant flood risk within a given study area. The PFRA involves collecting information on past (historic) and future (potential) floods, assembling the information into a PFRA report with supplemental Annexes, and identifying Flood Risk Areas.

1.1.2 This preliminary assessment report for the London Borough of Southwark provides a high level summary of significant flood risk, based on available and readily derivable information, describing both the probability and harmful consequences of past and future flooding. The development of new information is not required, but new analysis of existing information may be needed.

1.1.3 This PFRA has been based on existing and readily available information and brings together information from a number of available sources such as the Environment Agency's national information (for example Flood Map for Surface Water) and existing local products such as Strategic Flood Risk Assessments (SFRAs) and Surface Water Management Plans (SWMPs). The methodology for producing this PFRA has been based on the Environment Agency's Final PFRA Guidance and Defra's Guidance on selecting Flood Risk Areas, both published in December 2010.

1.2 BACKGROUND

1.2.1 The primary driver behind the PFRA is the Flood Risk Regulations 2009, which came into law on the 10th December 2009 and seek to transpose the EC Floods Directive (Directive 2007/60/EC on the assessment and management of flood risks) into domestic law in England and Wales and to implement its provisions.

1.2.2 In particular the Regulations place duties on the Environment Agency and Lead Local Flood Authorities (LLFAs) to prepare a number of documents including:

- Preliminary Flood Risk Assessments;
- Flood hazard and flood risk maps;
- Flood Risk Management Plans.

1.2.3 The purpose of the PFRA report under the Regulations is to provide the evidence for identifying Flood Risk Areas. The report will also provide a useful reference point for all local flood risk management and inform local flood risk strategies.

1.2.4 The scope of the PFRA is to consider past flooding and potential future flooding from the sources of flooding other than main rivers, the sea and reservoirs. In particular this includes surface runoff, flooding from groundwater and ordinary watercourses and any interaction these have with local drainage systems.
1.3 **OBJECTIVES**

1.3.1 The key objectives of the PFRA are summarised as follows:

- Collect information on past (historic) and future (potential) floods within the study area and record it within the PFRA spreadsheet;
- Assemble the information into a PFRA report;
- Review the indicative Flood Risk Areas delineated by the Environment Agency and where necessary provide explanation and justification for any amendments required to these;
- Provide a summary of the systems used for data sharing and storing and the provision for quality assurance, security and data licensing arrangements;
- Describe arrangements for partnership and collaboration for ongoing collection, assessment and storage of flood risk data and information;
- Identify relevant partner organisations involved in future assessment of flood risk; and summarise means for future and ongoing stakeholder engagement;
- Provide a useful reference point for all local flood risk management and inform future local strategies.

1.4 **STUDY AREA**

1.4.1 The study area is defined by the administrative boundary of the London Borough of Southwark, which is located in central London, extending from the River Thames in the north to Dulwich in the south and covers an area of approximately 29km$^2$. Southwark is a large inner city borough, with many distinct districts including Bermondsey, Borough and Bankside, Camberwell, Dulwich, Nunhead and Peckham Rye, Peckham, Rotherhithe and Walworth. Southwark is one of the greenest boroughs in London containing more than 130 green areas including Dulwich and Southwark Park, Burgess Park, Peckham Rye Common and many sports grounds and squares.

1.4.2 The borough has a total population of approximately 285,000, and around 117,000 households, of which almost half comprise public sector housing. There are 112 schools in the borough\(^1\).

1.4.3 Strategic road and rail networks, controlled by the Mayor for London via Transport for London (TfL) and rail operators, traverse the borough. These include thirteen ‘red routes’ classed as major routes through London managed by TfL, nine tube stations connecting to the Jubilee, Northern and Bakerloo lines, London Bridge overland rail station which is the fourth busiest rail terminal in London serving over 54 million people a year and a comprehensive bus network.

1.4.4 The study area topography is characterised by a distinct line (approximated by the A202), with a basin of low lying land to the north, and relatively undulating land, rising away in the south of the borough. The underlying geology is divided, with London Clay in the south and River Terrace deposits present in the north of the borough.

\(^1\) Best available estimates at time of publication. See London Councils Website for further information.
1.4.5 The study area falls into the Thames River Basin District (RBD) (as defined by the Environment Agency) and is located in the Environment Agency South East Region. The water utility provider is Thames Water Utilities Ltd.
2. LLFA Responsibilities

2.1 LEGISLATIVE BACKGROUND

2.1.1 The key drivers behind the PFRA are two pieces of new legislation, the Flood Risk Regulations 2009 which came into law on the 10th December 2009, and the Flood & Water Management Act (FWMA) which gained Royal Assent on the 8th April 2010.

2.1.2 The Flood Risk Regulations 2009 were created to transpose the EC Floods Directive (Directive 2007/60/EC) into domestic law in England and Wales. The Floods Directive provides a framework to assess and manage flood risks in order to reduce adverse consequences for human health, the environment (including cultural heritage) and economic activity.

2.1.3 The Flood and Water Management Act 2010 makes specific provision for the recommendations provided by Sir Michael Pitt in his independent review of the flooding experienced across much of England and Wales in 2007.

2.1.4 Under these pieces of legislation, all Unitary Authorities are designated ‘Lead Local Flood Authorities’ (LLFA) and have formally been allocated a number of key responsibilities with respect to local flood risk management.

2.2 LEADERSHIP & PARTNERSHIP

2.2.1 The Flood and Water Management Act 2010 defines the unitary authority, in this case the London Borough of Southwark, as the Lead Local Flood Authority (LLFA). As such, the London Borough of Southwark is responsible for leading local flood risk management, including establishing effective partnerships within their local authority as well as with external stakeholders such as the Environment Agency, Thames Water Utilities Ltd, Transport for London, Network Rail and London Underground as well as others. Ideally these working arrangements should be formalised to ensure clear lines of communication, mutual co-operation and management through the provision of Level of Service Agreements (LoSA) or Memorandums of Understanding (MoU).

Existing Flood Risk Management within the London Borough of Southwark

2.2.2 At present the responsibility for flood risk management at Southwark is shared across the following departments

- Strategic Planning;
- Emergency Planning and Resilience; and
- Asset Management (also responsible for drainage).

2.2.3 Discussions are currently underway to determine future governance arrangements for local flood risk management in the Borough. However an internal flood risk management partnership is being formed which will in addition to above mentioned incorporate representatives from Capital Projects, Parks and Open Spaces, Housing, Neighbourhoods and Regeneration, Corporate Risk, Communication, Legal, Data Management Departments, Sustainability and Climate Change.
Strategic Flood Group

2.2.4 As part of the Drain London Project, the London Borough of Southwark has been working closely with neighbouring boroughs to forge partnerships with respect to local flood risk management as part of the preparation of Surface Water Management Plans for all 33 London Boroughs.

2.2.5 As part of this work, it suggested that a South Central London Flood Partnership be formed (comprising of the London Boroughs of Lambeth and Southwark and other strategic partners) that would report to the Regional Flood Defence Committee through Councillor Hargrove at the London Borough of Southwark. The proposed structure for the management of flood risk in the future is as set out in Figure 2-1.

Figure 2-1 Organogram of Potential South Central London Flood Partnership

2.3 STAKEHOLDER ENGAGEMENT

2.3.1 As part of the preparation of PFRAs and SWMPs across London, there has been considerable stakeholder engagement involving the following organisations and authorities:

- Environment Agency
- Thames Water Utilities Ltd
- Neighbouring London Boroughs
- British Waterways
- London Fire Brigade
- Network Rail
- London Underground
- Transport for London
- Highways Agency
- Natural England

2.4 PUBLIC ENGAGEMENT

2.4.1 Members of the public may also have valuable information to contribute to the PFRA and to an improved understanding and management of local flood risk within the study area. Public engagement can afford significant benefits to local flood risk management including building trust, gaining access to additional local knowledge and increasing the chances of stakeholder acceptance of options and decisions proposed in future flood risk management plans.
2.4.2 However it is also recognised that it is crucial to plan the level and timing of engagement with communities predicted to be at risk of flooding from surface water, groundwater and ordinary watercourses. This is to ensure that the potential for future management options and actions is adequately understood and costed without raising expectations before solutions can reasonably be implemented.

2.4.3 It is important to undertake some public engagement when formulating local flood risk management plans, following the designation of Flood Risk Areas within the study area as this will help to inform future levels of public engagement. It is recommended that the London Borough of Southwark follows the guidelines outlined in the Environment Agency’s “Building Trust with Communities” which provides a useful process of how to communicate risk including the causes, probability and consequences to the general public and professional forums such as local resilience forums.

2.5 OTHER RESPONSIBILITIES

2.5.1 Besides forging partnerships, coordinating and leading on local flood management, there are a number of other key responsibilities that have arisen for Lead Local Flood Authorities from the Flood & Water Management Act 2010, and the Flood Risk Regulations 2009. These responsibilities include:

- **Investigating flood incidents** – LLFAs have a duty to investigate and record details of significant flood events within their area. This duty includes identifying which authorities have flood risk management functions and what they have done or intend to do with respect to the incident, notifying risk management authorities where necessary and publishing the results of any investigations carried out.

- **Asset Register** – LLFAs also have a duty to maintain a register of structures or features which are considered to have an effect on flood risk, including details on ownership and condition as a minimum. The register must be available for inspection and the Secretary of State will be able to make regulations about the content of the register and records.

- **SuDS Approving Body** – LLFAs are designated the SuDS Approving Body (SAB) for any new drainage system, and therefore must approve, adopt and maintain any new sustainable drainage systems (SuDS) within their area. This responsibility is anticipated to commence from April 2012.

- **Local Flood Risk Management (LFRM) Strategies** – LLFAs are required to develop, maintain, apply and monitor a strategy for local flood risk management in its area. The LFRM strategy will build upon information such as national risk assessments and will use consistent risk based approaches across different local authority areas and catchments.

- **Works powers** – LLFAs have powers to undertake works to manage flood risk from surface runoff and groundwater, consistent with the local flood risk management strategy for the area.

- **Designation powers** – LLFAs, as well as district councils and the Environment Agency have powers to designate structures and features that affect flooding in order to safeguard assets that are relied upon for flood risk management. Once a feature is designated, the owner must seek consent from the authority to alter, remove or replace it.
3. Methodology & Data Review

3.1 DATA SOURCES & AVAILABILITY

3.1.1 Table 3-1 provides a summary of the data sources held by partner organisations including a description of the dataset and its availability at the time of writing.

<table>
<thead>
<tr>
<th>Dataset</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Environment Agency Flood Map (Fluvial)</td>
<td>Shows the extent of flooding from rivers with a catchment of more than 3km² and from the sea.</td>
</tr>
<tr>
<td>Areas Susceptible to Surface Water Flooding</td>
<td>A national outline of surface water flooding held by the EA and developed in response to Pitt recommendations.</td>
</tr>
<tr>
<td>Flood Map for Surface Water</td>
<td>A second generation of surface water flood mapping which was released at the end of 2010.</td>
</tr>
<tr>
<td>Areas Susceptible to Groundwater Flooding</td>
<td>Mapping showing areas susceptible to groundwater flooding.</td>
</tr>
<tr>
<td>National Receptors Dataset</td>
<td>A nationally consistent dataset of social, economic, environmental and cultural receptors including residential properties, schools, hospitals, transport infrastructure and electricity substations.</td>
</tr>
<tr>
<td>Indicative Flood Risk Areas</td>
<td>National mapping highlighting key flood risk areas, based on the definition of ‘significant’ flood risk agreed with the Defra.</td>
</tr>
<tr>
<td>Historic Flood Map</td>
<td>Attributed spatial flood extent data for flooding from all sources.</td>
</tr>
<tr>
<td>Strategic Flood Risk Assessments (SFRA)</td>
<td>The London Borough of Southwark’s Level 1 SFRA (February 2008) contains useful information on historic flooding, including local sources of flooding from surface water and groundwater.</td>
</tr>
<tr>
<td>London Borough of Southwark Local Climate Impacts Profiles (LCLIP) Report for London Local Authorities</td>
<td>The LCLIP report for the London Borough of Southwark (March 2010), identifies weather-related impacts and their associated consequences on infrastructure and services across the London Borough of Southwark.</td>

<tr>
<td>DG5 Register for Thames Water Utilities areas</td>
<td>DG5 Register logs and records of sewer flooding incidents in the London Borough of Southwark.</td>
</tr>
<tr>
<td>Historical flooding call-out records</td>
<td>Records of all London Fire Brigade callouts for ‘flooding’ events since 2000. However, no flooding source is provided, so could be a result of water mains bursting as well as heavy rainfall / surface water flooding.</td>
</tr>
<tr>
<td>Areas Prone To Flooding</td>
<td>A list of areas prone to flooding across their South East Territory.</td>
</tr>
<tr>
<td>Flooding records – July 2007</td>
<td>Records relating to station closures (location and duration) on 20th July 2007 due to heavy rainfall.</td>
</tr>
</tbody>
</table>
3.2 LIMITATIONS

3.2.1 A number of issues arose during the data collection process, as described below:

Incomplete Datasets / Lack of Data

3.2.2 The London Borough of Southwark’s drainage team holds digital records (excel) of locations affected by flooding in April 2004 and locations known to regularly flood during heavy rainfall. However, there are no records of flooding either prior to or following this event, while there is evidence that flooding has occurred on numerous other occasions (supported by local newspaper articles). This has resulted in incomplete flood record datasets and corresponding gaps in flood data.

Recording of Flooding Incidents

3.2.3 In the event of flooding, the term contractor is called out to attend. In the process a job is raised in the work management system (which is linked to a GIS system) to identify the location of the incidence. Additional information regarding the causes of flooding is recorded and stored either electronically or by paper filing. However, there is limited information recorded within the system with regards to the extent and consequences of the flooding.

Records of Consequences of Flooding

3.2.4 No data providers were able to provide comprehensive details of the consequences of specific past flood events, which made accurately assessing the consequences of historic flooding difficult.

3.3 SECURITY, LICENSING AND USE RESTRICTIONS

3.3.1 A number of datasets used in the preparation of this PFRA are subject to licensing agreements and use restrictions.

3.3.2 The following national datasets provided by the Environment Agency are available to local authorities and their consultants for emergency planning and strategic planning purposes:

- Flood Map for Rivers and the Sea
- Areas Susceptible to Surface Water Flooding
- Flood Map for Surface Water
- National Receptor Database

3.3.3 A number of the data sources used are publicly available documents, such as:

- Strategic Flood Risk Assessment
- Catchment Flood Management Plan
- Surface Water Management Plan

3.3.4 The analyses to prepare the indicative Flood Risk Areas issued to accompany the final PFRA Guidance were based on the National Receptors Database (NRD) version 1.0 (for the counts of properties and other receptors). Receptor information was prepared for all London Boroughs in December 2010 in order to undertake property counts required for the SWMPs, also using NRD version 1.0. Version 1.1 of the NRD has subsequently been issued and contains modifications and corrections since version 1.0. However, in order to avoid
repetition of work, and ensure consistency between the SWMP and the PFRA, it was decided to complete the PFRA using NRD version 1.0.

3.3.5 The use of some of the datasets made available for this PFRA has been restricted and is time limited. These were licensed to the London Borough of Southwark via the Greater London Authority for use under the Drain London project, including the production of a PFRA for Southwark Council. The restricted datasets include records of property flooding held by the Council and by Thames Water Utilities Ltd, and data licensed by the Environment Agency.

3.3.6 Necessary precautions must be taken to ensure that all information given to third parties is treated as confidential. The information must not be used for anything other than the purpose stated in the agreement. No information may be copied, reproduced or reduced to writing, other than what is necessary for the purpose stated in the agreement.

3.4 QUALITY ASSURANCE

3.4.1 The datasets used to inform this PFRA were collected centrally for all London Boroughs as part of the Tier 1 Drain London work package of works. All data received was subject to quality assurance measures to monitor and record the quality and accuracy of the data and information. A data quality score was given to all the data which is a qualitative assessment based on the Data Quality System provided in the SWMP Technical Guidance (March 2010). This system is explained in Table 3-2.

Table 3-2 Data Quality System (SWMP Technical Guidance March 2010)

<table>
<thead>
<tr>
<th>Data Quality Score</th>

</table>

3.4.2 The use of this system provides a basis for analysing and monitoring the quality of data that is being collected and used in the preparation of the PFRA. As mentioned in Section 3.2, some of the datasets collected for this PFRA were of poor quality, and this has been identified and recorded using this system.
4. Past Flood Risk

4.1 SUMMARY OF PAST FLOODS

4.1.1 Table 4-1 provides a summary of past flood incidents in the study area.

<table>
<thead>
<tr>
<th>Date</th>
<th>Description</th>

<td>20th July 2007</td>
<td>Heavy rainfall caused Surrey Quays railway station to be closed for 3 hours due to flooding on 20th July 2007 (as reported by Network Rail).</td>
</tr>
</tbody>
</table>
4.1.2 The following figures show records of past flooding within the London Borough of Southwark:

- Figure 1 - Surface Water Flooding and Fluvial Flooding Incidents
- Figure 2 - Groundwater Flooding Incidents and Increased Potential for Elevated Groundwater (iPEG) (See Section 5.2 for further information)
- Figure 3 - Sewer Flooding Incidents (DG5 data provided by Thames Water, June 2010)

4.2 SIGNIFICANT HARMFUL CONSEQUENCES

4.2.1 The Flood Risk Regulations require PFRAs to report detailed information on past flood events that had ‘significant harmful consequences’. There is no national definition of what constitutes ‘significant harmful consequences’; it is a matter for local decision based on local information collected through the PFRA process.

4.2.2 It is considered that none of the events described in Table 4.1 constitute a ‘significant harmful event’ in terms of having significant consequences for human health, economic activity, the environment or cultural heritage. Therefore no records have been included in Annex 1 of the PFRA spreadsheet.

4.2.3 A complete record of locations where flooding has occurred will be kept by the London Borough of Southwark as a future evidence base. This base will be built up in the future through ensuring full details of flood events are recorded; this will then be used to support and inform future PFRA cycles as well as Southwark’s Local Flood Risk Management Strategy.

4.3 INTERACTIONS WITH OTHER FLOODING SOURCES

4.3.1 Flooding is often the result of water from more than one source, or water building up because another source (such as a river, or the sea) has prevented it from discharging normally. Information about past flooding will often be about an unknown source (i.e. it is not clear where the water came from), or flooding as a result of interactions between sources (in which case more than one source may be recorded).

4.3.2 Where flood records within the study area are known to be from more than one flood source, this has been recorded in the PFRA spreadsheet. Where the source of flooding is not known this has also been recorded.
5. Future Flood Risk

5.1 SUMMARY OF FUTURE FLOOD RISK

5.1.1 Information about future flood risk, or potential flooding, is usually produced by computer models. The Environment Agency has several national datasets showing risk of flooding from surface water, groundwater, main rivers and ordinary watercourses that are available to LLFAs. These datasets have been used to undertake an assessment of the number of properties and any important receptors that may be at risk of future flooding. Further details are provided in Annex 2 of the PFRA spreadsheet.

Surface Water Flooding

5.1.2 The Environment Agency has undertaken a property count for each LLFA for both their national Flood Map for Surface Water (FMfSW) and Areas Susceptible to Surface Water Flooding (AStSWF) datasets. It is intended that these are used to provide an indication of the number of residential and non-residential properties that are a risk from surface water flooding within each LLFA.

5.1.3 Using the Environment Agency’s property count information for the FMfSW dataset, it is estimated that 54,600 residential properties and 6,100 non-residential properties in the London Borough of Southwark could be at risk of surface water flooding of greater than 0.1m depth during a rainfall event with a 1 in 200 annual chance of occurring. Of those, 11,700 residential properties and 1,600 non-residential properties are estimated to be at risk of flooding to a depth of greater than 0.3m during the same modelled rainfall event.

5.1.4 Details are provided in Annex 2 of the PFRA spreadsheet.

Ordinary Watercourses

5.1.5 The Detailed River Network has been used to identify the ordinary watercourses and the Environment Agency Flood Map, showing flooding from rivers and the sea, has been used to identify the risk of future flooding from ordinary watercourses.

5.1.6 However there is insufficient data in the Flood Map regarding ordinary watercourses within the study area to make an accurate assessment of the future flood risk associated with these watercourses.

5.2 LOCALLY AGREED SURFACE WATER INFORMATION

Surface Water Flooding

5.2.1 In addition to these national datasets more locally specific surface water information is available for the study area. The London Borough of Southwark is currently undertaking a Surface Water Management Plan as part of the Drain London Programme. As part of this study, direct rainfall modelling has been undertaken to simulate surface water flooding in the study area. This provides an improved understanding of the level of flood risk facing the London Borough of Southwark over that provided in the Environment Agency’s national FMfSW and AStSWF datasets (Section 5.1.2).

5.2.2 It has been agreed, in conjunction with Environment Agency and Council officers, that the SWMP outputs will form the locally agreed surface water information for the London Borough of Southwark.
5.2.3 Figures 4 and 5 show the results from this modelling for a rainfall event with a 1 in 200 annual chance of occurring. For a full methodology, the reader is referred to the SWMP for the London Borough of Southwark.

- Figure 4 - Maximum Flood Depth – 1 in 200 chance of rainfall event occurring in any given year (0.5% AEP)
- Figure 5 - Flood Hazard – 1 in 200 chance of rainfall event occurring in any given year (0.5% AEP)

5.2.4 Surface water modelling completed as part of Tier 2 of the Drain London Project affords an improved understanding of the level of flood risk facing the London Borough of Southwark. As part of the SWMP produced for each LLFA, a property count has been undertaken using the Environment Agency’s National Receptors Dataset (NRD). Using the Drain London property count, it is estimated that 33,220 residential properties and 2,870 non-residential properties in the London Borough of Southwark could be at risk of surface water flooding of greater than 0.03m depth during a rainfall event with a 1 in 200 annual chance of occurring. Of those, 560 residential properties and 80 non-residential properties are estimated to be at risk of flooding to a depth of greater than 0.5m during the same modelled rainfall event. Further information on the property count methodology and property counts for other rainfall events are provided in the London Borough of Southwark SWMP.

5.2.5 The pluvial modelling undertaken as part of the Drain London project shows that the areas of Herne Hill, Dulwich Village, Camberwell and Peckham could be at risk of surface water flooding.

**Groundwater Flooding**

**Background**

5.2.6 Large areas within the Drain London region are underlain by permeable substrate and thereby have the potential to store groundwater. Under some circumstances groundwater levels can rise and cause flooding problems in subsurface structures or at the ground surface. The mapping technique described below aims to identify only those areas in which there is the greatest potential for this to happen and in which there is the highest possible confidence in the assessment.

5.2.7 The following four data sources have been utilised to produce the increased Potential for Elevated Groundwater map:

- British Geological Survey (BGS) Groundwater Flood Susceptibility Map;
- Jacobs Groundwater Emergence Maps (GEMs);
- Jeremy Benn Associates (JBA) Groundwater Flood Map; and
- Environment Agency/Jacobs Thames Estuary 2100 (TE2100) groundwater hazard maps.

5.2.8 To produce the iPEG map for consolidated aquifers, an area was defined as having increased potential for elevated groundwater levels if at least two of the three mapping techniques listed above produced a corresponding area. For the permeable superficial

---

2 Property thresholds have been modelled at 100mm above ground level. Therefore, where a property is shown or recorded as flooded, it is where flooding has been modelled to occur within the property itself.
deposits, only Band 1 Very High of the BGS and the TE2100 data were used as this was judged to best represent the hazard.

5.2.9 The techniques used to generate the iPEG map produced some small areas of increased potential and some dry islands within increased potential areas. These have not been cleaned in order to best represent the original data.

How to Use and Interpret the Map

5.2.10 The increased Potential for Elevated Groundwater map shows those areas within the Borough where there is an increased potential for groundwater to rise sufficiently to interact with the ground surface or be within 2 m of the ground surface.

5.2.11 Groundwater may become elevated by a number of means:

- Above average rainfall for a number of months in Chalk outcrop areas;
- Shorter period of above average rainfall in permeable superficial deposits;
- Permeable superficial deposits in hydraulic continuity with high water levels in the river;
- Interruption of groundwater flow paths; and
- Cessation of groundwater abstraction causing groundwater rebound.

5.2.12 With the exception of groundwater rebound which is not covered, the iPEG map will identify those areas most prone to the mechanisms described above. The map shows those areas considered to have the greatest potential for elevated groundwater. Additional areas within the London Boroughs have permeable geology and therefore could also produce elevated groundwater levels. However, to produce a realistic map, only where there is the highest degree of confidence in the assessment are the areas delineated. This ensures resources are focused on the most susceptible areas. In all areas underlain by permeable substrate, groundwater should still be considered in planning developments.

5.2.13 Within the areas delineated, the local rise of groundwater will be heavily controlled by local geological features and artificial influences (e.g. structures or conduits) which cannot currently be represented. This localised nature of groundwater flooding compared with, say, fluvial flooding suggests that interpretation of the map should similarly be different. The map shows the area within which groundwater has the potential to emerge but it is unlikely to emerge uniformly or in sufficient volume to fill the topography to the implied level. Instead, groundwater emerging at the surface may simply runoff to pond in lower areas.

5.2.14 For this reason within iPEG areas, locations shown to be at risk of surface water flooding are also likely to be most at risk of runoff/ponding caused by groundwater flooding. Therefore the iPEG map should not be used as a “flood outline” within which properties at risk can be counted. Rather it is provided, in conjunction with the surface water mapping, to identify those areas where groundwater may emerge and if so what would be the major flow pathways that water would take.

Results

5.2.15 Figure 2 shows the iPEG mapping for the London Borough of Southwark, alongside groundwater flooding incidents reported in the borough in the last ten years. The iPEG mapping shows that there is increased potential for elevated groundwater in the northwest of the borough.
5.3 IMPACT OF CLIMATE CHANGE

5.3.1 There is clear scientific evidence that global climate change is happening now. It cannot be ignored.

5.3.2 Over the past century around the UK we have seen sea level rise and more of our Winter rain falling in intense wet spells. Seasonal rainfall is highly variable. It seems to have decreased in Summer and increased in Winter, although Winter amounts changed little in the last 50 years. Some of the changes might reflect natural variation; however the broad trends are in line with projections from climate models.

5.3.3 Greenhouse gas (GHG) levels in the atmosphere are likely to cause higher Winter rainfall in future. Past GHG emissions mean some climate change is inevitable in the next 20-30 years. Lower emissions could reduce the rate of climate change further into the future, but changes are still projected at least as far ahead as the 2080s.

5.3.4 We have enough confidence in large scale climate models to say that we must plan for change. There is more uncertainty at a local scale but model results can still help us plan to adapt. For example we understand rain storms may become more intense, even if we can't be sure about exactly where or when. By the 2080s, the latest UK climate projections (UKCP09) are that there could be around three times as many days in Winter with heavy rainfall (defined as more than 25mm in a day). It is plausible that the amount of rain in extreme storms (with a 1 in 5 annual chance or rarer) could increase locally by 40%.

Key Projections for Thames River Basin District

5.3.5 If emissions follow a medium future scenario, UKCP09 projected changes by the 2050s relative to the recent past are:

- Winter precipitation increases of around 15% (very likely to be between 2 and 32%);
- Precipitation on the wettest day in Winter up by around 15% (very unlikely to be more than 31%);
- Relative sea level at Sheerness very likely to be up between 10 and 40cm from 1990 levels (not including extra potential rises from polar ice sheet loss);
- Peak river flows in a typical catchment likely to increase between 8 and 18%.

Implications for Flood Risk

5.3.6 Climate changes can affect local flood risk in several ways. Impacts will depend on local conditions and vulnerability.

5.3.7 Wetter Winters and more of this rain falling in wet spells may increase river flooding in both rural and heavily urbanised catchments. More intense rainfall causes more surface runoff, increasing localised flooding and erosion. In turn, this may increase pressure on drains, sewers and water quality. Storm intensity in Summer could increase even in drier Summers, so we need to be prepared for the unexpected.

5.3.8 Rising sea or river levels may increase local flood risk inland or away from major rivers because of interactions with drains, sewers and smaller watercourses.
5.3.9 There is a risk of flooding from groundwater-bearing chalk and limestone aquifers across the district. Recharge may increase in wetter Winters, or decrease in drier Summers.

5.3.10 Where appropriate, we need local studies to understand climate impacts in detail, including effects from other factors like land use. Sustainable development and drainage will help us adapt to climate change and manage the risk of damaging floods in future.

Adapting to Change

5.3.11 Past emission means some climate change is inevitable. It is essential we respond by planning ahead. We can prepare by understanding our current and future vulnerability to flooding, developing plans for increased resilience and building the capacity to adapt. Regular review and adherence to these plans is key to achieving long-term, sustainable benefits.

5.3.12 Although the broad climate change picture is clear, we have to make local decisions against deeper uncertainty. We will therefore consider a range of measures and retain flexibility to adapt. This approach, embodied within flood risk appraisal guidance, will help to ensure that we do not increase our vulnerability to flooding.

Pluvial Modelling Including Allowance for Climate Change

5.3.13 As part of the pluvial modelling completed for the Surface Water Management Plan for the London Borough of Southwark, a model scenario has been undertaken including an allowance for climate change. Figure 6 shows the results for the maximum flood depth during the rainfall event with a 1 in 100 annual chance of occurrence, including an allowance for climate change. Figure 7 shows the flood hazard rating for the same return period.

- Figure 6 Maximum Flood Depth – 1 in 100 Chance of rainfall event occurring in any given year (1% AEP) plus Climate Change
- Figure 7 Flood Hazard – 1 in 100 Chance of rainfall event occurring in any given year (1% AEP) plus Climate Change

5.3.14 As part of the SWMP produced for each LLFA, a property count has been undertaken using the Environment Agency’s National Receptors Dataset (NRD). Using the Drain London property count, it is estimated that 34,010 residential properties and 2,960 non-residential properties in the London Borough of Southwark could be at risk of surface water flooding of greater than 0.03m depth during a rainfall event with a 1 in 100 annual chance of occurring including an allowance for climate change³. Of those, 660 residential properties and 90 non-residential properties are estimated to be at risk of flooding to a depth of greater than 0.5m during the same modelled rainfall event³. Further information on the property count methodology and property counts for other return periods are provided in the London Borough of Southwark SWMP.

³ Property thresholds have been modelled at 100mm above ground level. Therefore, where a property is shown or recorded as flooded, it is where flooding has been modelled to occur within the property itself.
5.4 MAJOR DEVELOPMENTS

5.4.1 The London Borough of Southwark Core Strategy details how the borough will meet the housing needs for the next 15 years, by delivering 24,450 homes before 2026.

5.4.2 Growth is concentrated in the following areas:

- Bankside, Borough and London Bridge Opportunity Area – at least 1,900 extra homes and 75,000m² of additional commercial space for new businesses, shops and cultural facilities;
- Elephant and Castle Opportunity Area – at least 4,000 extra homes and 400,000 – 500,000m² of additional commercial space for new shopping, leisure and cultural facilities;
- Canada Water (and Rotherhithe) Action Area – at least 2,500 extra new homes and at least 35,000m² of additional commercial space for expanded retail facilities;
- Aylesbury Action Area – phased redevelopment of the Aylesbury estate between 2009 and 2027 will proved 4,500 new homes (1,450 more than currently in area);
- Peckham and Nunhead Action Area – at least 2,000 extra homes and 20,000m² of additional commercial space; and,
- Camberwell Action Area – lesser amount of development expected compared to other Action Areas; and,
- Old Kent Road Action Area – no specific housing and commercial development figures agreed.

5.5 LONG TERM DEVELOPMENTS

5.5.1 It is possible that long term developments might affect the occurrence and significance of flooding. However current planning policy aims to prevent new development from increasing flood risk.

5.5.2 In England, Planning Policy Statement 25 (PPS25) on development and flood risk aims to "ensure that flood risk is taken into account at all stages in the planning process to avoid inappropriate development in areas at risk of flooding, and to direct development away from areas at highest risk. Where new development is, exceptionally, necessary in such areas, policy aims to make it safe without increasing flood risk elsewhere and where possible, reducing flood risk overall."

5.5.3 Adherence to Government policy ensures that new development does not increase local flood risk. However, in exceptional circumstances the Local Planning Authority may accept that flood risk can be increased contrary to Government policy, usually because of the wider benefits of a new or proposed major development. Any exceptions would not be expected to increase risk to levels which are "significant" (in terms of the Government's criteria).
6. Review of Indicative Flood Risk Areas

6.1 Extent of Flood Risk Areas

6.1.1 The figure included in Annex 5 shows the Indicative Flood Risk Areas that have been identified by the Environment Agency.

6.1.2 The administrative area of Greater London, including the London Borough of Southwark is shown to be included in an Indicative Flood Risk Area.

6.2 Review Comments

6.2.1 No changes are proposed to the Greater London Indicative Flood Risk Area. On a London Borough by London Borough basis, the Flood Risk Area would not exceed the national threshold, however no changes are proposed given that the Flood Risk Area for Greater London will be managed as a whole.
7. Identification of Flood Risk Areas

7.1 AMENDMENTS TO FLOOD RISK AREAS

7.1.1 The London Borough of Southwark is not proposing any amendments to the Indicative Flood Risk Area for Greater London.

7.2 NEW FLOOD RISK AREA

7.2.1 The London Borough of Southwark is not proposing any new Flood Risk Areas.
8. Next Steps

8.1 Scrutiny & Review

8.1.1 As the Lead Local Flood Authority, the London Borough of Southwark is required to review and approve this PFRA in accordance with the Council's internal processes, such as consideration by Cabinet, Council or an overview and scrutiny committee.

8.1.2 The PFRA will initially go through the internal quality audit procedure by officers responsible to ensure the quality meets the Council's standard. The document will be put before the cabinet member for Environment, Transport and Recycling for further review. Any recommendation made by the cabinet member will be incorporated in the final version before being forwarded to the Environmental Agency.

8.1.3 The PFRA process will be reviewed on a 6-year cycle and for future iterations of the PFRA for the London Borough of Southwark an increasing level of information will be required including information which is optional for this first cycle relating to past flooding.

8.1.4 In order to ensure that this information is available for future reviews, a number of steps are being implemented as part of the Action Plan for the Surface Water Management Plan for the London Borough of Southwark. A number of key actions have been identified in the following sections.

8.2 Data Collection & Management

8.2.1 At the present time there is no consistent approach across the Local Authority for recording flood risk incidents and managing historic datasets including details of the sources and consequences of flood events.

8.2.2 The Council proposes to set up a dedicated team of officers for the management of Flood Risk in the borough. The team will be responsible for investigating and recording findings from all flood events. The details to be captured have been set out in the Drain London Flood Incident Record Template. It comprises of a simple spreadsheet which captures details of the flooding event such as the causes, location, extent and impact among others. Other details such as the sources of information will be collected and stored. This information will be kept on the Council's database and will be available for public inspection.

8.3 Other Requirements Under the Flood Risk Regulations 2009

8.3.1 Table 8-1 provides a summary of the elements of work required from the London Borough of Southwark under the Flood Risk Regulations 2009, along with the timescales of their respective delivery. The first two elements of work are covered by the preparation of this PFRA report.
### 8 Next Steps

**Table 8-1 Elements of Work required under the Flood Risk Regulations 2009**

<table>
<thead>
<tr>
<th>Date</th>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>22nd June 2011</td>
<td>Prepare Preliminary Assessment Report.</td>
<td>The PFRA should focus on local flood risk from surface water, groundwater, ordinary watercourses and canals.</td>
</tr>
<tr>
<td>22nd June 2011</td>
<td>On the basis of the PFRA, identify Flood Risk Areas.</td>
<td>Flood Risk Areas are areas of significant risk identified on the basis of the findings of the PFRA, national criteria set by the UK Government Secretary of State and guidance provided by the Environment Agency.</td>
</tr>
<tr>
<td>22nd June 2013</td>
<td>Prepare Flood Hazard Maps and Flood Risk Maps for each Flood Risk Area.</td>
<td>Used to identify the level of hazard and risk of flooding within each Flood Risk Area to inform Flood Risk Management Plans.</td>
</tr>
<tr>
<td>22nd June 2015</td>
<td>Prepare Flood Risk Management Plans for each Flood Risk Area.</td>
<td>Plans setting out risk management objectives and strategies for each Flood Risk Area.</td>
</tr>
</tbody>
</table>

8.3.2 As part of the next phase of work, due for submission in June 2013, the London Borough of Southwark will be required to prepare Flood Hazard Maps and Flood Risk Maps for their local authority area; these are being produced as part of the Drain London project, but may require minor amendments or upgrading prior to submission to the European Commission in June 2013. The maps will be required to inform Flood Risk Management Plan which will be due for submission in June 2015 setting out risk management objectives and strategies for the Flood Risk Area. The findings of this PFRA as well as that of the Surface Water Management Plan for the London Borough of Southwark should form the basis of the local flood risk management strategy for the area.

8.3.3 Further information can be found on the Environment Agency PFRA e-Learning module [http://learning.environment-agency.gov.uk/courses/FCRM/capacity](http://learning.environment-agency.gov.uk/courses/FCRM/capacity) which has been developed as part of Defra’s Capacity Building Strategy and is designed to provide users with an increased knowledge of the background and methodology involved in carrying out a PFRA.

Annex 1 – Past Floods

Please refer to Annex 1 of the Preliminary Assessment Spreadsheet, which has been supplied alongside this report. As discussed in Section 4.2, due to the lack of data available regarding the consequences of past flooding, no flood events have been considered to have 'significant harmful consequences', and therefore none have been recorded in Annex 1 of the Preliminary Assessment Spreadsheet.
Annex 2 – Future Floods

Please refer to Annex 2 of the Preliminary Assessment Spreadsheet, which has been supplied alongside this report.
Annex 3 – Flood Risk Areas

Please refer to Annex 3 of the Preliminary Assessment Spreadsheet, which has been supplied alongside this report.
Annex 4 – Review Checklist

Please refer to Annex 4 spreadsheet, which has been supplied alongside this report. Annex 4 contains the Review Checklist that has been provided by the Environment Agency to act as a checklist for reviewing PFRA submissions.
Annex 5 – GIS Layer of Flood Risk Areas

Please refer to Annex 5 GIS layer, which has been supplied alongside this report. This GIS layer is the same as the Environment Agency Indicative Flood Risk Area layer.
Annex 6 – Figures

Please refer to Annex 6 pdf document, which has been supplied alongside this report. The figures provided are as follows:

Figure 1 - Surface Water Flooding and Fluvial Flooding Incidents

Figure 2 - Groundwater Flooding Incidents and Increased Potential for Elevated Groundwater (iPEG)

Figure 3 - Sewer Flooding Incidents

Figure 4 - Maximum Flood Depth – 1 in 200 chance of rainfall event occurring in any given year (0.5% AEP)

Figure 5 - Flood Hazard – 1 in 200 chance of rainfall event occurring in any given year (0.5% AEP)

Figure 6 - Maximum Flood Depth – 1 in 100 Chance of rainfall event occurring in any given year (1% AEP) plus Climate Change

Figure 7 - Flood Hazard – 1 in 100 Chance of rainfall event occurring in any given year (1% AEP) plus Climate Change
